MIGRATORY WILDLIFE VULNERABILITY ASSESSMENT

- Migratory wildlife introduce difficult challenges for VA:
 - Highly extravagant lifestyles
 - Where? Breeding range, wintering range, stopover sites, migration itself, all of above?
 - Synchronicity?
 - Data hard to come by from parts of range

RED KNOT - SUPERMIGRANTS

RED KNOT – WHERE ARE THE VULNERABILITIES?

- ◆ Tierra del Fuego?
- ◆ Argentina cc
 ◆ Brazil?
- ♦ Mid-Atlantic states?
- → Hudson's Bay?
- → High Arctic?

Comprehensive VA needed

Vulnerabilities of Shorebirds to Climate Change

Hector Galbraith¹, Stephen Brown¹, David W. DesRochers², J. Michael Reed

¹Manomet Center for Conservation Sciences ²Dalton State College ³Tufts University

Objectives

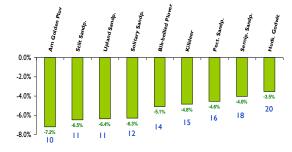

- Evaluate potential change in extinction risk or North American shorebirds due to climate change
 - directly due to effects of climate change
 - not those due to changed human activities associated with climate change

Why Shorebirds?

- Reported widespread declines
- Proposed to be sentinels of global environmental change – particularly because of their hemispheric ecosystem use during life cycle (Brown et al. 2001; Piersma Undström 2004)
- Migratory aggregations of some species are a spectacular biological phenomenon
- Iconic species valued by public?

SHOREBIRDS ARE INTROUBLE

Based on migration counts in eastern N.America; Bart et al 2007. JAv. Biol

Our Approach

- ◆ Evaluates threats to shorebirds by species
- Works within the context of the Partners-in-Flight
 U.S. Shorebird Conservation Plan risk systems
 - based on population size & trend, breeding & non-breeding distributions, threats to breeding & non-breeding sites

MAIN QUESTIONE ASKED

 How much does climate change move the needle on the existing vulnerability categories of USCP/PIF?

U.S. Shorebird Conservation Plan Risk Categories 1) Not at Risk 2) Low Concern 3) Moderate Concern 4) High Concern 5) Highly Imperiled 6) Holy Smokes!—Really,

highly imperiled

Vulnerability Factors					
	Score	Arrow			
1) Loss/gain in breeding habitat under

Semipalmated Sandpiper Score Arrow						
1) Loss/gain in breeding habitat under	30016	AITOW				
climate change		↑				
Loss/gain in wintering habitat under climate change	5	^				
Loss/gain in migration habitat under climate change		↑				
Degree of dependence on ecological synchronicities	5	↑ ↑				
5) Migration distance	4					
Degree of breeding, wintering, or migration habitat specialization	4	↑↑				
Change in status from 'moderate concern' to 'highly imperiled'						

Application

- Evaluated 49 species of shorebird breeding in North American north of Mexico
- For each factor, included confidence level
- → Summed arrows
- Determined shifts in risk category

Results for 50 North Am. Shorebirds

- ◆ 43 species (86%) predicted to ↑ risk leve due to climate change
 - 34 increased by 1 level
 - 9 increased by 2 levels
- 3 species at lower risk

- Solitary sandpiper more breeding habital
- ◆ Bristle-thighed curlew more breeding & wintering habitat
- ◆ White-rumped sandpiper more wintering

U.S. Shorebird Conservation Plan

Risk Category	Current	Expected with climate change
Not at risk	0	0
Low concern	7	2
Moderate concern	15	7
High concern	23	13
Highly imperiled	4	17
Critical	_	10

Species in New 'Critical' Category Snowy Plover Wilson's Plover Piping Plover Mountain Plover Am. Oystercatcher Something Something Something Short-billed dowitcher

Where from here?

- Species-specific risk assessmer
- ID common risks as focus for management activity
 - e.g., shoreline habitat on migration routes & wintering areas
- Still reviewing the assessments & considering degree of threat to shift risk category
- We welcome feedback, things to consider, insights, information

TAKE HOME MESSAGES

- For complex spp. We need complex, comprehensive VA
- They are doable
- Build off of existing structures if possible (PIF, NAWP, etc.)
- Must be resilient to lack of data
